

電気情報工学基礎演習B

Control a Mobile Robot: Lecture 6

Instructor: 蔡 凱

TA: 川村 聡志

Week 6

Same goal as last week

- steer the robot to **reach a goal**, *and*
- **avoid nearby obstacles**

but with a different method

- ***Switching*** between controllers

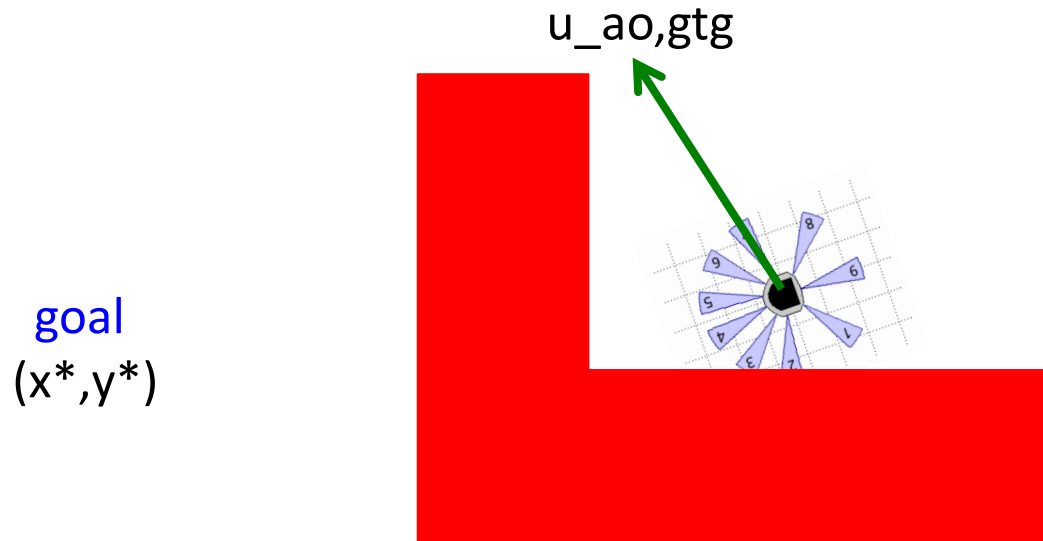

No Obstacle Around

goal
(x^* , y^*)

Initially, use GoToGoal control.

Obstacle Detected

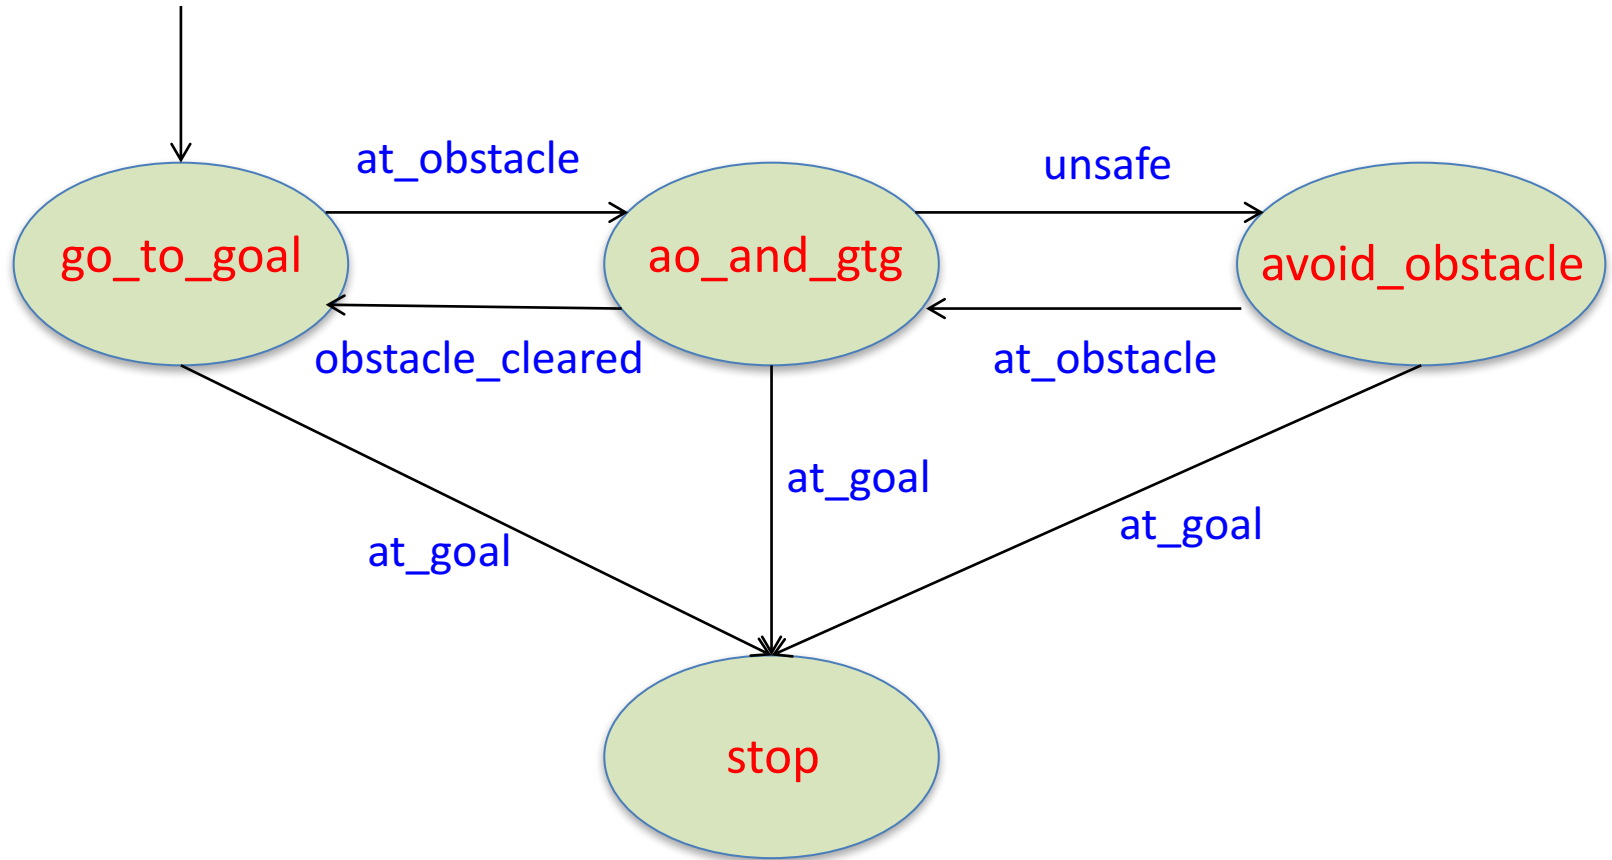

When close to an obstacle, use AO and GTG control.

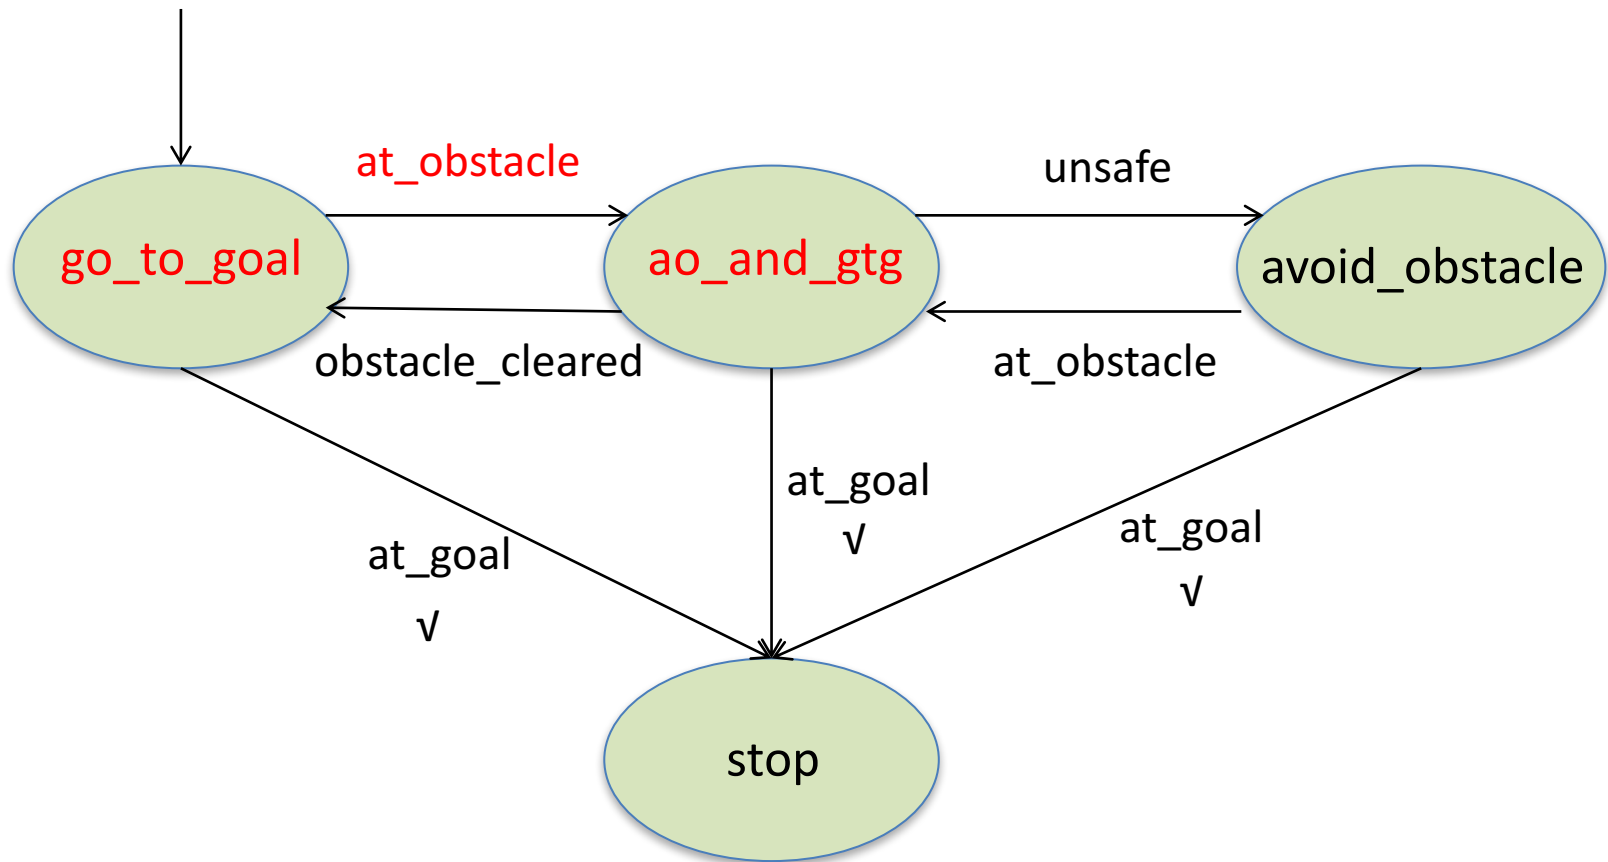

Too Close To Obstacle

If too close to an obstacle (**unsafe**), use **AvoidObstacle** control.

Switching Controller

% At controller 'go_to_goal', if 'at_obstacle' is true,
 % then switch to controller 'ao_and_gtg'

```

if(obj.is_in_state('go_to_goal'))
    if(obj.check_event('at_obstacle'))
        obj.switch_to_state('ao_and_gtg');
    end
end
end
  
```

Code

- +simiam/+controller/GoToGoal.m
 - function obj=GoToGoal(): [see Lecture 3](#)
- +simiam/+controller/AvoidObstacles.m
 - function obj = AvoidObstacles(): [see Lecture 4](#)
- +simiam/+controller/AOandGTG.m
 - function obj=AOandGTG(): [see Lecture 5](#)

Have Fun

- **Change** robot's initial pose in settings.xml
- **Set** robot's linear speed, goal location, and stop distance, distance close to obstacles, distance too close to obstacles in K3Supervisor.m
- **Design** controller switching logic in K3Supervisor.m
- **Adjust** parameters in GoToGoal.m, AvoidObstacles.m, and AOandGTG.m
